

## Meeting minutes #9

From meeting date : 10 MAR 2017 9.00-10.00 AM

Next meeting date : 24 MAR 2017 9.00-10.00 AM

Today, we've talk about the results from implementing task create a reservation, sign in, set timezone, and see specific user's reservation in backend (python) and to see sites' description, sign in and set timezone in frontend.

Comment:

- Checking about django, flask or WSGI if it help to implement backend easier.
- In sign in page, it should have menu forget password.
- Think about how to manage session in many cases, such as when user's browser crash and then they open it again.
- The marker cluster (circle marker) should have label which link from before and after zoom in the map or click on that marker type.
- The map should include something that can tell user which map scale user in.
- It should have the instruction for user who use first time.
- It should have the label to tell user about the color of marker.
- When user click on the same marker, its card should reorder to top of the list.
- The title bar of card should change to be "Select for reservation" and move site's name to over date of description.
- "No selected resource" at right panel should be changed to be "click on the marker to view information."
