

Meeting minutes # 3

From meeting date : 09-11-2016 8.00-9.00 AM

Next meeting date : 23-11-2016 9.00-10.00 AM

Today we've discussed about the UI flow of 2 tasks:

1. Create a new reservation
2. Search resources or filter

Comment

- Highlight the pin marker on the map when user select.
- We have to think about some step that can make user confuse. For example, this step has reserve button on top right and we have next button on the reservation window, it will make user confuse which one they should click for going to next step.

- And if we allow user to edit the site list on reservation window, we should concern about consistency of the information between the reservation window and the right panel.
- Search resource function support only for single cluster on a single site, and if user click any result it should be showed on the right panel and use the same flow to reserve.
- “Connection type” should be changed to “additional network” and the option includes None by default, IPOP, and ENT.
